

Streamlined Backup, Restore, and Disaster Recovery for Microsoft® Exchange

DS3 DataVaulting offers secure, streamlined backup of Microsoft® Exchange 2000, 2003, and 2007. Using DS3, full information store (I/S) restore and disaster recovery can be completed with ease and in a fraction of the time required by other products and services. The Message Level Restore (MLR) feature provides backup and restore with granularity down to specific email objects, such as messages and contacts, without taking the email server offline. With data management solutions for the entire enterprise, DS3 is the optimal choice for protection of your Microsoft® Exchange environment.

Reliable, Easy Service for Full Information Store

DS3 DataVaulting provides backup and restore features for the full I/S, which simplifies backup processes and prepares for disaster recovery. With an agent-less architecture, the entire I/S is backed up without affecting end users. DS3's delta-blocking and compression capabilities enable a full I/S backup while dramatically reducing the amount of data transmitted and stored. Restores of the latest backup are quickly performed over the local LAN via the DS3 "gateway." During a restore, there is no need to track "full" or "incrementals" because DS3 handles the reconstruction to a target Exchange server just by selecting a date for the backup. These capabilities can also be applied to Novell GroupWise and IBM Lotus Notes/Domino Server.

Individual Restore of Messages Made Simple

With the MLR feature, DS3 backs up and restores specific mailboxes, folders, and objects through a user-friendly graphic interface without interfering with the server. This option is perfect for restoring individual messages or contacts accidentally deleted or needed for management or legal purposes. During the MLR backup, the I/S is scanned and all new and modified email objects are backed up individually. The system can be set to back up emails as soon as they arrive without waiting for a scheduled nightly backup. To restore, a mailbox, folder, or single object can be returned to the original user or an administrator's mailbox.

Streamlined Backup, Restore, and Disaster Recovery for Microsoft® Exchange

DS3 DataVaulting is a reliable partner that offers companies a streamlined, secure, and scalable data management solution. From servers, to workstations, to laptops, DS3 provides backup, restore, and disaster recovery for the entire enterprise. Our automated process virtually eliminates human error, and offsite backup is made even more secure with advanced encryption technology. DS3's agent-less architecture makes set-up simple. Our services are highly compatible with a wide range of network platforms and applications. DS3 offers an enhanced return on investment by saving companies time and money. Finally, all services and features are covered by one "pay for what you use" monthly cost and fully supported by our dedicated customer service team. In business longer than any other dedicated industry player of our size, at DS3 DataVaulting we deliver on our commitment to be a full service data management resource.

"My DS3 Exchange restore worked perfectly. It was handled quickly and efficiently with no errors. When I had to do it with tape, it was a pain. With DS3, it was simple, fast, and convenient."
